Jago 3D Workshop

Build a scene from artwork, objects and light.

Shape an object, apply a surface and stage it with a camera. Try a paper model, a printable form, a projection study or a short animated scene.

Your first few minutes

1. Open Jago-3D-Workshop.exe or launch 3D Workshop from Workscape.
2. Open Prism for a holographic paper poster or Kinetic Orbit for a motion study.
3. Select an object and change its finish. Then adjust the camera or lighting and save the scene.
4. Use Output to choose a still, motion, print or projection workflow.

Version 0.13.0 | Windows application

What you can do

Jago 3D Workshop 0.13.0

- Make editable solids from shapes, drawn outlines and turned profiles.
- Apply artwork to a sheet or object and control how it sits on the surface.
- Set a floor, environment, camera and lighting. Try the ocean and sky stages.
- Use paper poses or Cloth Playground to shape a sheet.
- Add motion to an object or camera and scrub the result.

A useful way to work

Material: export a Workshop surface package and open it from From Material.

Keep your editable project alongside finished exports. A rendered image, audio file or video preserves the result; the native project preserves the editing controls.

Working in the studio

Tools and workflows

- Use Shift+F to focus the canvas and Escape to return. F frames the set.
- Use Q to select, W to move, E to rotate and R to scale. Turn on Snap when placing objects precisely.
- Use the object inspector for construction and materials. Use Light & camera for the scene around it.
- In Afterimage, show the projector guides to see where the light starts and which surface it reaches.
- In Cloth Playground, pause to shape the sheet deliberately. Save the pose when ready.

Keep exploring

Use the editable examples and in-app help to try another direction. Save a copy before experimenting with an important project.

The controls described here are included in this version. Optional local tools are identified in the practical details; they do not run continuously.

Save, share & connect

Files you can keep

- Save an editable Workshop scene before exporting.
- Use PNG for a still image and the motion output for a loop or frames.
- Use the print checks before exporting a printable model. Inspect the result in a slicer.
- Use the projection tools to rehearse and check alignment on the intended display.

Connected workflows

- Material: export a Workshop surface package and open it from From Material.
- Pulse and Library: import a rendered still or a supported motion output for the next stage.
- Workscape: launch Workshop alongside the other studios.

Practical details

Keep the executable and supporting files together. Workshop opens in its own window from Workscape.

Projection rehearsal and final alignment depend on the target display and surface.

Check wall thickness, dimensions and the final model in a slicer before printing.

Opening: Extract the complete ZIP and open Jago-3D-Workshop.exe. Keep supporting files together. The shared suite installer can install this app on its own.
